

BASIC MEASURES OF RISK

WHAT WILL YOU LEARN?

- ▶ Types of risk
- ▶ Basic measures of risk

TYPES OF RISK

- ▶ Business cycle
- ▶ Credit
- ▶ Default
- ▶ Interest rate
- ▶ Exchange rate
- ▶ Liquidity
- ▶ Volatility
- ▶ Political
- ▶ Market
- ▶ Legal
- ▶ Operational

HOW DO WE MEASURE RISK?

- ▶ The most common measure of risk is volatility of returns.
- ▶ Volatility is measured by the standard deviation σ of a return distribution.

VOLATILITY

► Given a sample of N returns,

EXAMPLE: RUSSELL 3000 QUARTERLY RETURNS

| | R3000 Quarterly return % | Deviation from the mean | $\pm\sigma$ |
|-----------------------------|-----------------------------|----------------------------|-------------|
| March 2003 | -24.66 | -37.48 | No |
| June 2003 | 0.77 | -12.05 | Yes |
| September 2003 | 25.92 | 13.11 | Yes |
| December 2003 | 31.06 | 18.25 | No |
| March 2004 | 38.19 | 25.38 | No |
| June 2004 | 20.46 | 7.65 | Yes |
| September 2004 | 14.26 | 1.45 | Yes |
| December 2004 | 11.95 | -0.87 | Yes |
| March 2005 | 7.09 | -5.73 | Yes |
| June 2005 | 8.05 | -4.77 | Yes |
| September 2005 | 14.57 | 1.76 | Yes |
| December 2005 | 6.12 | -6.70 | Yes |
| | | | |
| Mean | 12.82% | | |
| Population std. dev. | 15.45% | | |
| Sample std. dev. | 18.13% | | |

ANNUALIZING VOLATILITY

SUMMARY

- ▶ A common measure of risk is the volatility of returns, measured as the standard deviation of the return distribution.

MEASURING BAD VARIATION

WHAT WILL YOU LEARN?

- ▶ Target semivariance
- ▶ Downside risk

WHAT IS SEMIVARIANCE?

- ▶ Semivariance is computed by squaring only negative deviations from the mean.
- ▶ The square root of semivariance is called semideviation.

TARGET SEMIVARIANCE

- ▶ Suppose you have a return target, or a minimal acceptable return (MAR).
- ▶ Target semivariance is the expected squared deviations below the target.
 - ▶ Target semideviation is the square root of target semivariance.
- ▶ Target semideviation is a measure of downside risk.

LOWER PARTIAL MOMENTS (LPM)

- Target semideviation is a special case of lower partial moments (LPM) methodology for dealing with downside variation.
- Formula for a lower partial moment of degree p

EXAMPLE: RUSSELL TOP 50 INDEX QUARTERLY DOWNSIDE SEMIVARIANCE

| Quarter | Return % | d(i) | Deviation | |
|--|----------|------|-----------|---------|
| 200109 | -13.39 | 1 | -13.39 | |
| 200112 | 8.98 | 0 | 8.98 | |
| 200203 | -1.69 | 1 | -1.69 | |
| 200206 | -16.40 | 1 | -16.40 | |
| 200209 | -15.93 | 1 | -15.93 | |
| 200212 | 10.55 | 0 | 10.55 | |
| 200303 | -2.52 | 1 | -2.52 | |
| 200306 | 13.95 | 0 | 13.95 | |
| 200309 | 1.16 | 0 | 1.16 | |
| 200312 | 10.17 | 0 | 10.17 | |
| 200403 | -0.57 | 1 | -0.57 | |
| 200406 | 1.04 | 0 | 1.04 | |
| | | | | |
| Tau | 0 | | | |
| | | | | |
| Mean Squared deviation = target semivariance | | | | 59.2957 |
| Target semideviation | | | | 7.700 |

UPSIDE SEMIDEVIATION

- Upside risk – upside semideviation – is the converse of downside deviation.

SUMMARY

- A common measure of risk is the volatility of returns, measured as the standard deviation of the return distribution.
- Downside semivariance is a special case of the LPM methodology with power $p = 2$ and target equal to the mean.
- Downside deviation is useful when comparing distributions that are not normal and have different means.

TRACKING ERROR AND RESIDUAL RISK

WHAT WILL YOU LEARN?

- ▶ Tracking error
- ▶ Residual risk

TRACKING ERROR

- Tracking error is the standard deviation of the arithmetic excess return.

RESIDUAL RISK

TRACKING ERROR VS. RESIDUAL RISK

- ▶ When beta is equal to 1, the tracking error and the residual risk are equal.
- ▶ When beta is not equal to 1, the tracking error and the residual risk differ from each other.

SUMMARY

- ▶ Tracking error and residual risk
- ▶ When alpha equals the arithmetic excess return, residual risk equals tracking error.
